Copying LLM Generated Scripts into FileMaker

Copying LLM generated scripts into FileMaker is as simple as a quick copy/paste.

The prompt shown here, (even though mis-spelled!) is requesting "FileMaker script XML" as a result.

The response from the LLM is a properly structured XML script performing the requested task.

- (1) Copy the LLM generated XML to the clipboard with the Copy button on the web UI. The clipboard contents will be UTF8 text.
- (2) In the FmPro Clipboard Explorer, set the FM Data Type menu to "Script".
- (3) Click the Paste button or Command/Control+V to copy this clipboard text into FmPro Clipboard Explorer.
- (4) Click the Set button or Command/Control+C to copy this data to the clipboard as a FileMaker script.
- (5) Within the FileMaker Script Workspace, Use Command/ Control+V to paste the script into the Script Workspace a new

Individual script steps can also be copied and pasted within existing Script Workspace scripts.

Drag & Drop FileMaker XML Files

XML files containing the <fmxmlsnippet> key are recognized as FileMaker objects by FmPro Clipboard Explorer. These files can be copied from FileMaker, exported, edited by external software and pasted back into FileMaker as the correct data type for the object they represent.

Alternatively, XML files can be generated entirely by other software, written into .XML files enclosed by the <fmxmlsnippet></fmxmlsnippety> key which will be recognized as valid files for importing into FmPro Clipboard
